

DIFFERENTIAL ENTROPY

Why

We want a notion of entropy for continuous random variables.

Definition

The relative entropy of a probability density function is the integral of the density against the negative log of the density.

Notation

Let R denote the set of real numbers. Let $f: R^n \to R$ be a probability density function. The differential entropy of f is

$$-\int f \log f$$

We denote the differential entropy of f by h(f).
