

## Natural Square Roots

## Why

We want to solve equations with squares.

## Definition

Let m be a square number. We want to find n to satisfy

$$n^2 = m$$
.

We call such an n a square root of m.

**Proposition 1.** The square root of a square number is unique.

This result motivates defining a function the square root function which square numbers to their roots.

## Notation

Let  $S \subset \mathbf{N}$  denote the set of square numbers. Let  $f: S \to N$  be the function such that f(s) is the square root of s. We denote the result of f on n by  $\sqrt{n}$ .
