

Partial Derivatives

Why

We want to talk about a function of multiple real-valued arguments changes with respect to changes in its arguments.

Definition

Consider a real-valued function on d-dimensional space. For $i=1,\ldots,d$, Fix a point x. consider the limit of a sequence of quotients of the difference of the result of that function at a point the consider the limit of a sequence of quotients of the value changed at component The partial derivative of the function with respect to the ith the function which maps d-dimensional vectors of real numbers to the limit of a seq of all of the quotient between the point to argument is the limit of the rate with a The partial derivative of a

Let
$$f: \mathbb{R}^d \to \mathbb{R}$$
 For $i = 1, \dots, d$, define Let $g_i: \mathbb{R}^d \to \mathbb{R}$ by
$$g_i(x) = \lim_{h \to 0} \frac{f(x + he_i) - f(x)}{h}$$

for each x
