

## REAL SQUARE ROOTS

## Why

We want to solve equations with squares.

## Definition

Let b be any real number. We want to find a to solve

$$a^2 = b$$
.

We call a solution a a square root of b.

**Prop.** 1. A positive real number has two square roots.<sup>1</sup>

Despite the above proposition, we still speak of the square root of a real number, which is the positive square root. We also speak of the square root function which associates a real number to its positive square root.

**Prop. 2.** A two roots or a positive real number are additive inverses.<sup>2</sup>

## Notation

As with natural numbers, we denote the (positive) square root of the real number  $x \in \mathbf{R}$  by  $\sqrt{x}$ . Some authors refer to both the roots of x by writing  $\pm \sqrt{x}$ .
