

COVARIANCE

Why

1

Definition

The *covariance* between two random variables which are each integrable and whose product is integrable is the expectation of their product less the product of their expectation.

Notation

Let f and g be two integrable random variables with fg integrable. Denote the covariance of f with g by cov(f,g). We defined it:

$$cov(f, g) = \mathbf{E}(fg) - \mathbf{E}(f)\mathbf{E}(g).$$

Properties

Prop. 1. Covariance is symmetric and billinear.²

Prop. 2. The covariance of a random variable with itself is its variance.

Proof. Let f be a square-integrable real-valued random variable, then

$$cov(f, f) = \mathbf{E}(ff) - \mathbf{E}(f)\mathbf{E}(f) = \mathbf{E}(f^2) - (\mathbf{E}(f))^2 = var(f).$$

¹Future editions will include this.

²Future editions will include an account.

Prop. 3. The variance of a sum of integrable real-valued random variables whose pairwise products are integrable is the double sum of the pairwise covariances.

Proof. Let f_1, \ldots, f_n be integrable random variables with $f_i f_j$ integrable for all $i, j = 1, \ldots, n$. Using the billinearity,

$$\operatorname{var}\left(\sum_{i=1}^{n} f_{i}\right) = \operatorname{cov}\left(\sum_{i=1}^{n} f_{i}, \sum_{i=1}^{n} f_{i}\right)$$
$$= \sum_{i=1}^{n} \sum_{j=1}^{n} \operatorname{cov}(f_{i}, f_{j})$$
