

# SEQUENCES

# Why

We want to speak of infinite processes, and to do so we define sequences indexed by N. In other words, important families are those indexed by the natural numbers.

# Definition

A sequence (infinite sequence) is a family whose index set is **N** (the set of natural numbers without zero). The *nth term* or coordinate of a sequence is the result of the *n*th natural number,  $n \in \mathbf{N}$ .

### Notation

Let A be a non-empty set and  $a: \mathbb{N} \to A$ . Then a is a (infinite) sequence in A. a(n) is the nth term. We also denote a by  $(a_n)_n$  and a(n) by  $a_n$ . If  $\{A_n\}_{n\in\mathbb{N}}$  is an infinite sequence of sets, then we denote the direct product of the sequence by  $\prod_{i=1}^{\infty} A_i$ .

### Natural unions and intersections

We denote the family of the infinite sequence of sets  $(A_n)_n$  by  $\bigcup_{i=1}^{\infty} A_i$ . Similarly, we denote the intersection of an infinite sequence of sets by  $\bigcap_{i=1}^{\infty} A_i$ , respectively.

<sup>&</sup>lt;sup>1</sup>Future editions may also comment that we are introducing language for the steps of an infinite process.
