

GROUPS

Why

We further drop conditions on the structure of the binary operations, and study only the algebraic structure of addition over the integers.

Definition

A group is an algebra (G, \circ) for which $\circ : G \times G \to G$ is associative, has an identity element in G, and has inverse elements. It is a commutative group (or abelian group) if \circ is commutative.

Additive groups

Suppose that $(R, +, \cdot)$ is ring. Then (R, +) is a commutative group. Conversely, suppose (G, +) is a commutative group. Define multiplication on S by $a \cdot b = 0$ for all $a, b \in R$. Then $(S, +, \cdot)$ is a ring, called the zero ring of (G, +). For this reason, it is customary to write + for the operations \circ when handling commutative groups.
