

## CHARACTERISTIC FUNCTIONS

## Why

We want to indicate membership in a set by a function.<sup>1</sup>

## **Definition**

The characteristic function of a set X is a function from X to 2 which is 1 if the argument is in A and 0 otherwise.

The function which assigns to each subset A of X to characteristic function of A is a one-to-one function from  $\mathcal{P}(X)$  onto  $2^X$ .

## Notation

Let A be a non-empty set and  $B \subset A$ . We denote the characteristic function of B in A by  $\chi_B : A \to R$ . The Greek letter  $\chi$  is a mnemonic for "characteristic".

The subscript indicates the set on which the function is one. In other words, for all  $B \subset A$ ,  $\chi_B^{-1}(\{1\}) = B$ .<sup>2</sup>

 $<sup>^1{\</sup>rm Future}$  editions will elaborate, perhaps with forward-looking connections to Rectangular Functions.

<sup>&</sup>lt;sup>2</sup>Another notation used, when referring to these as "indicator functions," is  $1_B: A \to \{0,1\}$  or  $\mathbf{1}_B$ .
