

#### RELATIONS

# Why

How can we relate the elements of two sets?

#### Definition

A relation between two nonempty sets is a subset of their cross product. A relation on a single set is a subset of the cross product of it with itself.

The *domain* of a relation is the set of all elements which appear as the first coordinate of some ordered pair of the relation. The *range* of a relation is the set of all elements which appear as the second coordinate of some ordered pair of the relation.

### **Notation**

Let A and B be two nonempty sets. A relation on A and B is a subset of  $A \times B$ . Let C be a nonempty set. A relation on a C is a subset of  $C \times C$ .

Let  $a \in A$  and  $b \in B$ . The ordered pair (a, b) may or may not be in a relation on A and B. Also notice that if  $A \neq B$ , then (b, a) is not a member of the product  $A \times B$ , and therefore not in any relation on A and B. If A = B, however, it may be that (b, a) is in the relation.

## **Notation**

Let A and B be nonempty sets with  $a \in A$  and  $b \in B$ . Since relations are sets, we can use upper case Latin letters. Let Rbe a relation on A and B. We denote that  $(a, b) \in R$  by aRb, read aloud as "a in relation R to b."

When A = B, we tend to use other symbols instead of letters. For example,  $\sim$ , =, <,  $\leq$ ,  $\prec$ , and  $\preceq$ .

# **Properties**

Often relations are defined over a single set, and there are a few useful properties to distinguish.

A relation is *reflexive* if every element is related to itself. A relation is *symmetric* if two objects are related regardless of their order. A relation is *antisymmetric* antisymmetric if two different objects are related only in one order, and never both. A relation is *transitive* if a first element is related to a second element and the second element is related to the third element, then the first and third element are related.

#### Notation

Let R be a relation on a non-empty set A. R is reflexive if

$$(a,a) \in R$$

for all  $a \in A$ . R is transitive if

$$(a,b) \in R \land (b,c) \in R \implies (a,c) \in R$$

for all  $a, b, c \in A$ . R is symmetric if

$$(a,b) \in R \implies (b,a) \in R$$

for all  $a, b \in A$ . R is anti-symmetric if

$$(a,b) \in R \implies (b,a) \not\in R$$

for all  $a, b \in A$ .
