

### MATRIX SIMILARITY

# Why

### TODO

#### Definition

A first square matrix is *similar* to a second square matrix if there exists a nonsingular matrix such that the first matrix is identical to the product of the inverse of the nonsingular matrix the second square matrix and the nonsingular matrix.

#### Notation

Let  $A, B \in \mathbb{R}^{n \times n}$ . B is similar to A if there exists a nonsingular matrix  $S \in \mathbb{R}^{n \times n}$  such that

$$B = S^{-1}AS.$$

## **Equivalence Relation**

**Prop.** 1. Similarity is an equivalence relation.
