

Real Integral Limit Inferior Bound

1 Why

TODO

2 Result

Proposition 1. The integral of the limit inferior of a sequence of measurable, nonnegative, extended-real-valued functions is no larger than the limit inferior of the sequence of integrals.

Proof. Let (X, \mathcal{A}, μ) be a measure space, and let $f_n : \to [0, \infty]$ a \mathcal{A} -measurable function for every natural number n. We want to show that if

 $\int \liminf_{n} f_n d\mu \le \liminf_{n} \int f_n d\mu.$
