

REAL LINE

Why

We are constantly thinking of the real numbers as the points of a line.¹

Discussion

We commonly associate elements of the real numbers (see Real Numbers) with points on a line (see Geometry).

Principle 1 (Point Sets). Given a line, there exists a set of its (infinite) points.

Principle 2 (Real Line Correspondence). Let P be the set of points for a line. There exists a one-to-one correspondence mapping elements of P onto elements of R.

For this reason, we sometimes call elements of the real numbers *points*. We call the point associated with 0 the *origin*.

Visualization

To visualize the correspondence we draw a line. We then associate a point of the line with the $0 \in \mathbb{R}$. We can label it so. We then pick a unit length. We associate the points a unit length away from zero with $1 \in \mathbb{R}$ (on the right) and $-1 \in \mathbb{R}$ (on the left). We do the same for two and 2 and -2, 3 and -3, and then we say that we could continue the process indefinitely. We can visualize the image in Figure 1.
