

## AFFINE MMSE ESTIMATORS

## **Definition**

We want to estimate a random variable  $x:\Omega\to \mathbf{R}^n$  from a random variable  $y:\Omega\to \mathbf{R}^n$  using an estimator  $\phi:\mathbf{R}^m\to \mathbf{R}^n$  which is affine.<sup>1</sup> In other words,  $\phi(\xi)=A\xi+b$  for some  $A\in \mathbf{R}^{n\times m}$  and  $b\in \mathbf{R}^n$ . We will use the mean squared error cost.

We want to find A and b to minimize

$$\mathbf{E} ||Ax + b - y||^2$$
.

Proof. Express 
$$\mathbf{E}(\|Ax + b - y\|^2)$$
 as  $\mathbf{E}((Ax + b - y)^{\top}(Ax + b - y))$   
+  $\operatorname{tr}(A\mathbf{E}(xx^{\top})A^{\top})$  +  $\mathbf{E}(x)^{\top}A^{\top}b$  -  $\operatorname{tr}(A^{\top}\mathbf{E}(yx^{\top}))$   
+  $b^{\top}A\mathbf{E}(x)$  +  $b^{\top}b$  -  $b^{\top}\mathbf{E}(y)$   
-  $\operatorname{tr}(A\mathbf{E}(xy^{\top}))$  -  $\mathbf{E}(y)^{\top}b$  +  $\mathbf{E}(yy^{\top})$ 

The gradients with respect to b are

so  $2A\mathbf{E}(x) + 2b - 2\mathbf{E}(y)$ . The gradients with respect to A are

so  $2\mathbf{E}(xx^{\top})A^{\top} + 2\mathbf{E}(x)b^{\top} - 2\mathbf{E}(xy^{\top})$ . We want A and b solutions to

$$A\mathbf{E}(x) + b - \mathbf{E}(y) = 0$$
 
$$\mathbf{E}(xx^{\top})A^{\top} + \mathbf{E}(x)b^{\top} - \mathbf{E}(xy^{\top}) = 0$$

so first get  $b = \mathbf{E}(y) - A\mathbf{E}(x)$ . Then express

$$\begin{split} \mathbf{E}(xx^\top)A^\top + \mathbf{E}(x)(\mathbf{E}(y) - A\mathbf{E}(x))^\top - \mathbf{E}(xy^\top) &= 0.\\ \mathbf{E}(xx^\top)A^\top + \mathbf{E}(x)\mathbf{E}(y)^\top - \mathbf{E}(x)\mathbf{E}(x)^\top A^\top - \mathbf{E}(xy^\top) &= 0.\\ (\mathbf{E}(xx^\top) - \mathbf{E}(x)\mathbf{E}(x)^\top)A^\top &= \mathbf{E}(xy^\top) - \mathbf{E}(x)\mathbf{E}(y)^\top.\\ &\quad \operatorname{cov}(x, x)A^\top &= \operatorname{cov}(x, y). \end{split}$$

<sup>&</sup>lt;sup>1</sup>Actually, the development flips this. Future editions will correct.

So  $A^{\top}=(\cos(x,x))^{-1}\cos(x,y)$  means  $A=\cos(y,x)(\cos(x,x))^{-1}$  is a solution. Then  $b=\mathbf{E}(y)-\cos(y,x)\cos(x,x)^{-1}\mathbf{E}(x)$ . So to summarize, the estimator  $\phi(x)=Ax+b$  is

$$\mathrm{cov}(y,x)(\mathrm{cov}\,x,x)^{-1}x+\mathsf{E}(y)-\mathrm{cov}(y,x)(\mathrm{cov}(x,x))^{-1}\mathsf{E}(x)$$

or

$$\mathbf{E}(y) + \cos(y, x)(\cos x, x)^{-1}(x - \mathbf{E}(x))$$
