## Definition

A real rational function (or rational function or fractional function) is a function  $f: \mathbf{R} \to \mathbf{R}$  for which there exists polynomials  $p: \mathbf{R} \to \mathbf{R}$  and  $q: \mathbf{R} \to \mathbf{R}$  so that f(x) = p(x)/q(x) for all  $x \in \mathbf{R}$ .

In this case we call p the numerator polynomial (and p the numerator function) and q the denominator polynomial (and q the denominator function). Of course, the language rational is in reference to the fact that if p and q are integer-valued functions, then the function f is a rational-valued function (see Rational Numbers).
