

FUNCTION GRAPHS

Why

We want to visualize function composition.

Definition

Let G be a graph (directed or undirected) on $\{1, \ldots, n\}$ and let A_1, \ldots, A_n be a sequence of sets. We call the ordered pair (G, A) a typed graph. We call A_i the *ith domain*. For $S \subset \{1, \ldots, n\}$, we denote the ordered product $\prod_{s \in S} A_s$ by A_s .

If G is directed, we call a source vertex i exogenous and otherwise we call a vertex endogenous.

Let $\bar{G} = (G, A)$ be a typed graph where G is directed. Let $f_i : A_{pa_i} \to A_i$ for $i = 1, \ldots, n$ so that f is a sequence of functions. We call the ordered pair (\bar{G}, f) a function graph¹ (or function diagram).

 $^{^{1}\}mathrm{This}$ sheet is not to be confused with the graph of a function (see Functions.
