

## SEQUENCE SPACES

## Why

We can view the set of sequences as vector spaces and give them norms.

## **Bounded sequences**

Let  $C^N$  denote the set of complex-valued sequences. Define  $\ell^\infty \subset C^N$  to be the set of all *bounded sequences*. That is,

$$\ell^{\infty} = \{ x \in \mathbf{C}^{\mathbf{N}} \mid \exists M \in \mathbf{R} \text{ with } |x_i| < M \text{ for all } i \}.$$

Then  $\ell^{\infty}$  with componentwise addition and scalar multiplication is a vector space.

Exercise 1. Define  $\|\cdot\|_{\infty}: \ell^{\infty} \to \mathbb{R}$  by

$$||x||_{\infty} = \sup_{n \in \mathbf{N}} |x_n|.$$

Then  $\|\cdot\|_{\infty}$  is a norm on  $\ell^{\infty}$ .

## Absolutely summable sequences

Let  $\ell^1 \subset \mathbf{C^N}$  denote the set of all absolutely summable sequences. In other words, for  $x \in \mathbf{C^N}$ ,  $x \in \ell^1$  if

$$\sum_{n=1}^{\infty} |x_n| < \infty.$$

Then  $\ell^1$  is a vector space with componentwise addition and scalar multiplication.

Exercise 2. Define  $\|\cdot\|_1:\ell^1\to \mathbf{R}$  by

$$||x||_1 = \sum_{n=1}^{\infty} |x_n|$$

Then  $\|\cdot\|_1$  is a norm on  $\ell^1$ .
