

SIMPLE FUNCTIONS

Why

We want to define area under a real function. We start with defining functions for which this notion is obvious.

Definition

A simple function (or step function) is a real-valued function whose range is a finite set. We can write simple function as the sum of the characteristic functions fo the inverse image elements.

We can partition the range of the function into a finite family of oneelements sets. Then the family whose members are the inverse images of these sets partitions the domain. We call this the *simple partition* of the function.

Notation

We denote the set of simple functions on A by SF(A). We denote subset of non-negative simple real functions with domain A by $SF_{+}(A)$.

Let
$$f \in SF(A)$$
. Let $\{a_1, ..., a_n\} = f(A)$. Define $A_i = f^{-1}(\{a_i\})$.
Then $f = \sum_{i=1}^n a_i \chi_{A_i}$.
