

## CANONICAL MAPS

## Why

How do equivalence classes and functions relate

## **Definition**

We can associate to each element of a set its equivalence class under an equivalence relation. Let X denote a set and R an equivalence relation. We call the function  $f: X \to X/R$  defined by f(x) = x/R the canonical map from X to X/R.

Conversely, if f is an arbitrary function from X onto Y, we can naturally define an equivalence relation R in X so that for  $a, b \in X$ ,  $a R b \longleftrightarrow f(a) = f(b) f$  was onto, so for each  $y \in Y$ , there exists an  $x \in X$  with f(x) = y. Now let  $g: Y \to X/R$  be defined by g(y) = x/R. The values of g are the subset X which are mapped to the same value under f. Moreover, the function g is one-to-one.
