

## **GROUPS**

## Why

We further drop conditions on the structure of the binary operations, and study only the algebraic structure of addition over the integers.

## Definition

A group is an algebra  $(G, \circ)$  for which  $\circ : G \times G \to G$  is associative, has an identity element in G, and has inverse elements. It is a commutative group (or abelian group) if  $\circ$  is commutative.

## Additive groups

Suppose that  $(R, +, \cdot)$  is ring. Then (R, +) is a commutative group. Conversely, suppose (G, +) is a commutative group. Define multiplication on S by  $a \cdot b = 0$  for all  $a, b \in R$ . Then  $(S, +, \cdot)$  is a ring, called the zero ring of (G, +). For this reason, it is customary to write + for the operations  $\circ$  when handling commutative groups.
