

### MATRIX-VECTOR PRODUCTS

# Why

## TODO

### Definition

The matrix-vector product between an  $m \times n$ -matrix and an n-vector is the result of the linear combination of the columns of the matrix with the sequence of scalars in the vector. So the matrix-vector product is an m-vector.

#### Notation

Let C be a nonempty set. Let  $A \in C^{m \times n}$  and let  $x \in C^n$ . We denote the matrix-vector product of A with x by Ax, read "A x".

If we denote Ax by b, then

$$b_i = \sum_{j=1}^n a_{ij} x_j$$

for  $i \in \{1, 2, ..., m\}$ . Let

$$A = \left[egin{array}{c} a_1^T \ a_2^T \ dots \ a_m^T \end{array}
ight]$$

Or, if  $a_i^T$  is the *i*th row of A, then

$$b_i = a_i^T x$$

for  $i \in \{1, 2, \dots, m\}$ .
