

## REAL POLYNOMIALS

## Why

What are some simple functions? Here's one answer: those that only involve addition and multiplication.<sup>1</sup>

## **Definition**

A real polynomial (or polynomial) of degree d is a function  $p: \mathbb{R} \to \mathbb{R}$  for which there exists a finite sequence  $a = (a_0, a_1, \dots, a_d)$  so that

$$p(x) = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^d.$$

In particular, q(x) = ax + b for  $a, b \in \mathbf{R}$  is a polynomial of the first degree and  $r(x) = ax^2 + bx + c$  for  $a, b, c \in \mathbf{R}$  is a polynomial of the second degree.

In a sense, these are "simple" functions. We require addition (and substraction) and multiplication; but no division.

## **Properties**

**Proposition 1.** Let  $p : R \to R$  be a polynomial of degree d. Then p is continuous.

**Proposition 2.** Let  $p : \mathbb{R} \to \mathbb{R}$  be a polynomial of degree d. Then p has derivatives of all orders. Every derivative of p is a polynomial.
