

Positive Semidefinite Matrix Order

Why

Can we order the cone of positive semidefinite matrices?

Definition

The positive semidefinite matrix order (or Loewner order) is a partial ordering \geq on S^d defined by

$$A \ge B \quad \longleftrightarrow \quad A - B \ge 0 \quad \longleftrightarrow \quad A - B \in \mathbf{S}_+^d.$$

We define the partial order > on symmetric matrices by

$$A > B \longleftrightarrow A - B > 0 \longleftrightarrow A - B \in \mathbf{S}_{++}^d$$

Properties

Each of the following results from the geometric properties of the positive semidefinite cone:

$$\alpha A \geq 0 \quad \text{ for all } \delta > 0, A \geq 0,$$

$$A + B \geq 0 \quad \text{ for all } A, B \geq 0,$$

$$A \geq B \text{ and } B \geq A \longrightarrow A = B \quad \text{ for all } A, B \in \mathbf{S}^d,$$

$$\lim_{n \to \infty} A_n = A \longrightarrow A \geq 0 \quad \text{ for all sequences } (A_n)_n \text{ in } \mathbf{S}^d_+.$$

Partial Order

 $A \geq B$ and $B \geq A$ giving A = B means that \geq is antisymmetric. Moreover,

$$A\geq A\quad \&\text{ for all }A\in \textbf{S}^d,\text{ and}$$

$$A\geq B\text{ and }B\geq C\longrightarrow A\geq C\&\text{ for all }A,B,C\in \textbf{S}^d.$$

In other words, \geq is also reflexive and transitive. In other words, \geq is a partial order (see Partial Orders).¹

 $^{^{1}\}mathrm{Future}$ editions will include more formal accounts.

For $d=1, \geq$ reduces to the familiar total order of the real line(see Real Order). The converse perspective is to see the positive semidefinite order as an extension of the order on \mathbf{R} to the space \mathbf{S}^d . Of course, the key difference is that two matrices may not be comparable. The order is partial.

For example, the matrices $A, B \in \mathbf{S}^2$ defined by

$$A = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}, \quad B = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$$

are not comparable. Neither $A \geq B$ nor $B \geq A$ holds.
