

### **TREES**

## Why

1

### Definition

An undirected graph is a *tree* if it is connected and acyclic. An undirected graph is a *forest* if it is acyclic. Each connected component of a forest is a tree, motivating the definition.

# **Properties**

**Proposition 1.** There is a unique path between any two vertices of a tree.

*Proof.* Such a path exists because the tree is connected. Such a path is unique because the existence of two separate paths would create a cycle.  $\Box$ 

#### Distance

The distance between two vertices v and w in a tree is the length of the unique path connnecting v and w. Recall that the length of a path is the number of edges, or one fewer than the number of vertices. If v and w are adjacent in the tree, then there distance is 1.
