

COMMON GROWTH CLASSES

Why

We are regularly referring to a few common growth classes.

Definitions

Let $c \in \mathbf{R}$. Then we name the following growth classes

growth class	name
O(1)	$constant\ growth\ class$
$O(\log(x))$	$logarithmic\ growth\ class$
$O(\log(x)^c)$	$polylogarithmic\ growth\ class$
O(x)	linear growth class
$O(x^2)$	quadratic growth class
$O(x^c)$	polynomial growth class
$O(c^x)$	exponential growth class

We have written these in order:

$$O(1) \subset O(\log(x)) \subset O((\log(x))^c) \subset \cdots \subset O(x^c) \subset O(c^x).$$

A function that grows faster (is in the upper growth class) of a power of x is called *superpolynomial*. One that grows slower than c^n for some $c \in \mathbf{R}$ is called *subexponential*. The class $O(\log(x^c)) = O(\log(x))$ since $\log(x^c) = c \log x$. Similarly, for all $c_1, c_2 > 0$, $O(\log_{c_1}(x)) = O(\log_{c_2}(x))$.

This list is useful because of the following

Proposition 1. Let $f, g : \mathbf{R} \to \mathbf{R}$ and defined $h : \mathbf{R} \to \mathbf{R}$ by h = f + g. If $O(f) \subset O(g)$, then $h \in O(g)$.

In other words, if a function h is the sum of f and g and g is growing faster, then g (the one growing faster) determines the order of h.
