

## **DECISION PROCESSES**

## Why

We want to talk about making a sequence of decisions.

## Definition

Let S and A be finite sets. Let  $T: S \times A \to (S \to [0,1])$  so that for each  $s \in S$  and  $a \in A$ ,  $T_{sa}: S \to [0,1]$  is a probability distribution over S. We call the ordered triple (S, A, T) a finite state-action process.

A trajectory in the state set S and action set A is a sequence in  $S \times A$ . We interpret

Let 
$$r: S \times A \times S \to \mathbb{R}$$
,  $N \in \mathbb{N}$ .

A decision process is a sequence  $(S, A, T, r, \gamma)$ , consists of two sets, a function set, an action

## Other terminology

Decision processes are commonly called *markov decision processes*.<sup>1</sup>

<sup>&</sup>lt;sup>1</sup>As usual, we avoid this terminology in connection with the projects guidelines against using particular names.
