

## **EGOPROX SEQUENCES**

## Why

We talk about sequences in a metric space which are "bunching up."

## **Definition**

A sequence in a metric space is *egoprox* (or *Cauchy*) if for every positive real number, there exists a final part of the sequence so that any two terms are less than the positive number apart.<sup>1</sup>

## Notation

Let (X,d) be a metric space. Then  $(x_n)_{n\in\mathbb{N}}$  a sequence in X is egoprox if, for every  $\varepsilon > 0$ , there exists  $N \in \mathbb{N}$  so that, for all  $m, n \geq N$ 

$$d(x_n, x_m) < \varepsilon$$
.

<sup>&</sup>lt;sup>1</sup>The term Cauchy is universal, but in accordance with the Bourbaki project's guidelines on naming, we will tend to use the term egoprox.
